Test -1

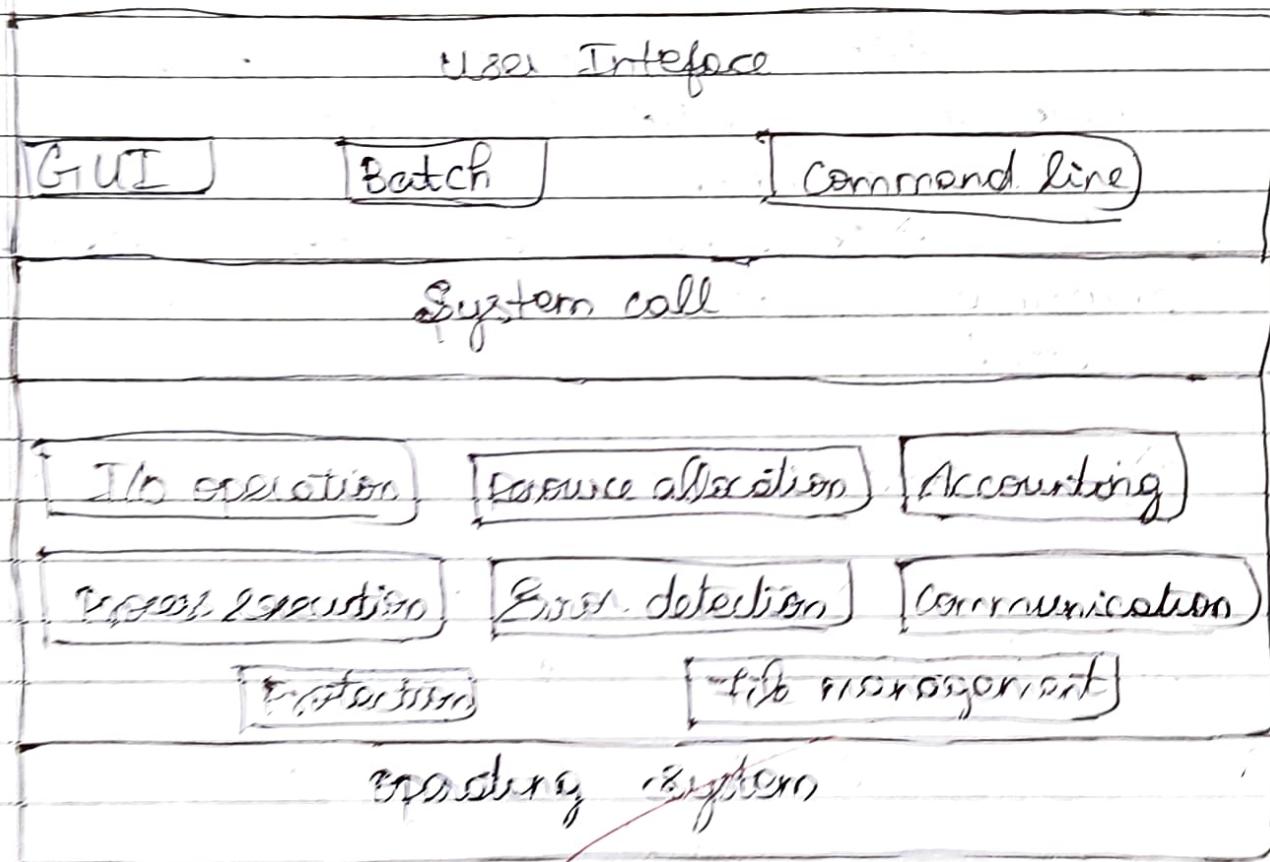

Module -1

1)

a) Operating system

Operating system is the system software which intermediates between hardware and user interface.

Services of operating system

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| D | D | M | M | Y | Y | Y | Y |
|   |   |   |   |   |   |   |   |

### i) Resource allocation

- \* Resource allocation is the main service provided by operating system.
- \* Resource like memory, CPU, I/O operations, time sharing etc... are divided & allocated to the process in need by the operating system.

### ii) Error detection:

- \* Operating systems helps the computer to detect error occurring in program execution.
- \* Operating system helps in handling detecting the specific point where error is created.

### iii) User Interface:

- \* OS provides the user interface to the user to perform properly.
- \* Three kinds of UI are there:
  - i) GUI
  - ii) Batch
  - iii) Command line user.

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| D | D | M | M | Y | Y | Y | Y |
|   |   |   |   |   |   |   |   |

### i) GUI:

Graphical User Interface is used in windows where there is an pointing object to access the user interface.

### ii) Batch:

commands and files are saved and compiled to execute the process.

### iii) Command line user:

command line user Interface asks commands from the user in one line to perform the task.

### iv) Accounting

\* operating system keeps track of all the process happening in the computer for billing purpose or any kind of future reference.

### v) Communication

\* operating system helps in communication between various parts and processes for resource sharing.

DD MM YY YY YY

### vi) I/O operations

\* Operating System helps in transfer of data between Memory and Input output devices and CPU.

### vii) Process execution

\* OS helps in the execution of the process using proper system calls.

### viii) File management.

\* OS helps in creating or destroying files.

- a) Read or write files.
- \* To store files.

### ix) Protection & Security

\* One of the most important thing is to give proper protection for the data and programs under execution.

\* OS helps in giving protection & security to the system.

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| D | D | M | M | Y | Y | Y | Y |
|   |   |   |   |   |   |   |   |

D.6)

### i) Multiprocessor System

\* Multiprocessor system is formed by the more than 1 CPU or processor.

\* Multiprocessor systems

Multiprocessor system

Blistered system

\* Multiprocessor system is formed by 2 or more CPU or processor connected together.

\* High performance due to the presence of many processors

\* Blistered system is formed by connecting 2 or more computers together.

\* Many computers are connected to common terminal so sharing of resource is easy.

\* Asymmetric:

Master/slave model

\* One CPU will act as a head mastering all other CPUs. The rest CPUs work according to the master.

\* Asymmetric:

\* one computer monitor all other computers.

\* When any computer stops working, the main computer work as that computer and becomes active.

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| D | D | M | M | Y | Y | Y | Y |
|   |   |   |   |   |   |   |   |

### \*Symmetric

All the CPU work together sharing the work.

### \*Symmetric

All the computers work together by sharing the work.

\*Economical profit  
As it avoids construction of many computer by having many processor.

\*Comparatively cost is high.

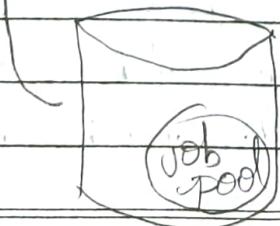

### i) Multiprogramming

\* In multiprogramming, all the jobs in the job pool are arranged in memory one after the other for execution.

|      |
|------|
| job1 |
| job2 |
| job3 |
| job4 |
| job5 |
| job6 |

### Multitasking

\* Different tasks executed frequently that they appear like many tasks are executing at the same time.

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| D | D | M | M | Y | Y | Y | Y |
|   |   |   |   |   |   |   |   |

\* Always keeps the CPU in working mode by assigning the task in order.

\* Many tasks are executed frequently that make the user to think all are executing at the same time.

\* When I/O operation are taking place, this won't make the CPU sit idle by giving the next job in the order and so on.

\* High performance rate and fast execution.

\* Increase the usage of CPU properly.

\* Reduces the time of execution of the process.

## Module-2

A collection of threads are  
and are each there in  
a -process

→ Thread is a basic unit of process.

Process is the execution of a ~~block~~ program as a whole

Thread is the execution of a particular block or line.
